Probability theory (10 Points)

Exercise 1 (Bayes’ rule, 1 point). Let $A, B, C$ be events. Assuming $P(B \mid C) \neq 0$, prove that
\[ P(A \mid B \cap C) = \frac{P(B \mid A \cap C) \cdot P(A \mid C)}{P(B \mid C)}. \]

Exercise 2 (Bayes’ rule, 5 points). Siegfried the ornithologist does a study on the green-speckled swallow. Since he has a huge collection of bird photographs he wants to find all images depicting a green-speckled swallow. Due to its distinctive features it is an easy task for Eduard, Siegfried’s friend and computer vision scientist, to program a green-speckled swallow detector that marks all images containing such a bird. Unfortunately the detector does not work perfectly. If the image contains a green-speckled swallow the detector marks it correctly with a chance of 99.5%. If the image does not contain a green-speckled swallow the detector marks it correctly with a chance of 99.3%. The bird is also very rare: If we randomly draw an image from the collection, there is only a chance of 0.001% that the image contains a green-speckled swallow.

a) Do a formal modeling of the experiment. How does the discrete probability space look like?

b) What is the probability that a green-speckled swallow is on a given image, if the detector gives a positive answer?

c) What is the probability that a green-speckled swallow is on a given image, if the detector gives a negative answer?

Exercise 3 (Independence, 2 points). Let $A$ and $B$ be events. Show that
\[ P(A \mid B) = P(A) \iff P(A \cap B) = P(A) \cdot P(B). \]

Exercise 4 (Conditional independence, 2 points). Let $A, B$ and $C$ be events. Show that the two definitions of the conditional independence are equivalent, that is,
\[ P(A \mid C) = P(A \mid B \cap C) \iff P(A \cap B \mid C) = P(A \mid C) \cdot P(B \mid C). \]
